

Introduce the project: a small demonstration program built during the Springboard AI for Programmers bootcamp. It's a learning project, not investment software.

The core idea: lean on crowd signals (social media chatter and prediction-market odds) rather than only traditional financial data.

This is the chained / human-in-the-loop pattern: the first call turns messy text into structured data, a human checks it, and only then does the second call run. Functions: ask_openai_hitl, get_human_confirmation, ask_openai.

Skills folder: code_reviewer, commit-messages, doc_writer, test_scaffolder, plus a draft for PR descriptions.

Tech stack

Tool	Role in the project
OpenAI API	GPT-4o mini for parsing and forecasting
Pydantic	Schema for the structured Query
LangSmith	Tracing and observability
Pinecone	Vector store for RAG (planned)
PyQt6	Desktop GUI prototype
Python 3	Platform-independent · Apache-2.0 licence

Anthropic is listed as a possible future provider. Package name in pyproject.toml: BusinessAnalyticsRose, version 0.1.0.

Be upfront: this is an early release. The Embeddings class is scaffolding adapted from course exercises and still needs fixes before it runs.

Items drawn from TODO.md and the README's Installing section.
